

You're halfway through the course and by now you should have a firm grasp on creating a basic pivot table from different kinds of source data.

You've learnt how to change the source, the method of summation and use various filtering techniques to only calculate the important information.

If you're happy with summarising your single source of data, you're all set. But in this next topic, we're going to look at Excel's built-in calculation tools that will compare our analysis by multiple criteria and provide further insights into our business performance.

We'll learn how to design our own bespoke calculations, calculate metrics unique to our organisation, and investigate how to connect multiple data sources to enable summarising by collections that aren't in our original data source.

Let's get started.
