

Congratulations – you’ve made it to the final topic in the course.

I hope by now you’ve learnt everything you wanted to know about PivotTables, and then some.

You’ve learnt how to create PivotTables from multiple and varied sources, how to make them stylish, how to connect data sources together, create bespoke calculations and comparisons and use all of the different filters.

In this topic we're going to bring it all together to create a dynamic dashboard with a graphic user interface to support end-user interaction, allowing stakeholders to decide which results are illustrated.

By creating interactive charts, we’ll permit our data to communicate with us and our stakeholders in pictures that tell the story of our organisational successes and failures.

We’re going to explore the different chart types, the chart styles, and the elements that can be applied to each. And we’ll discuss the factors to consider when choosing the most appropriate chart type for your purpose.

On completion of this last topic, you will have attained the skills necessary to turn complex data into easy-to-read, visually appealing, decision-making insights, graphically presented for measuring performance, reporting to stakeholders, and making informed business decisions.

Let's get started.
